# Demo: First MVC Project

Author: Baifan Zhou

Open VS Code, click `Open Folder...` Go to the parental folder where you would like to put your First MVC project.

Start the Terminal, run the command:

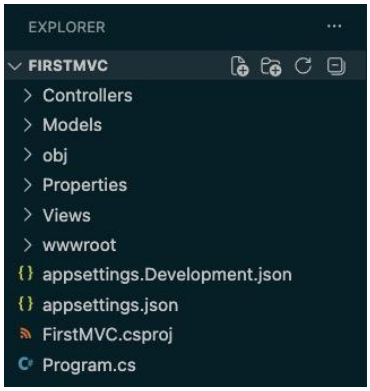

```
dotnet new mvc -n FirstMVC
```

change directory to the FirstMVC folder:

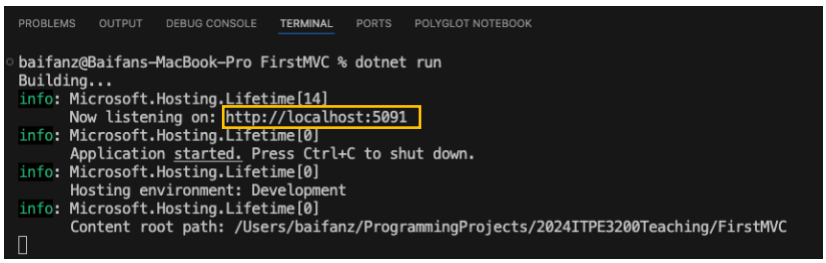

```
cd FirstMVC
```

You can use `Open Folder...` in VS Code to open a new window that only displays the FirstMVC folder

Some files are generated in the Explorer of VS Code

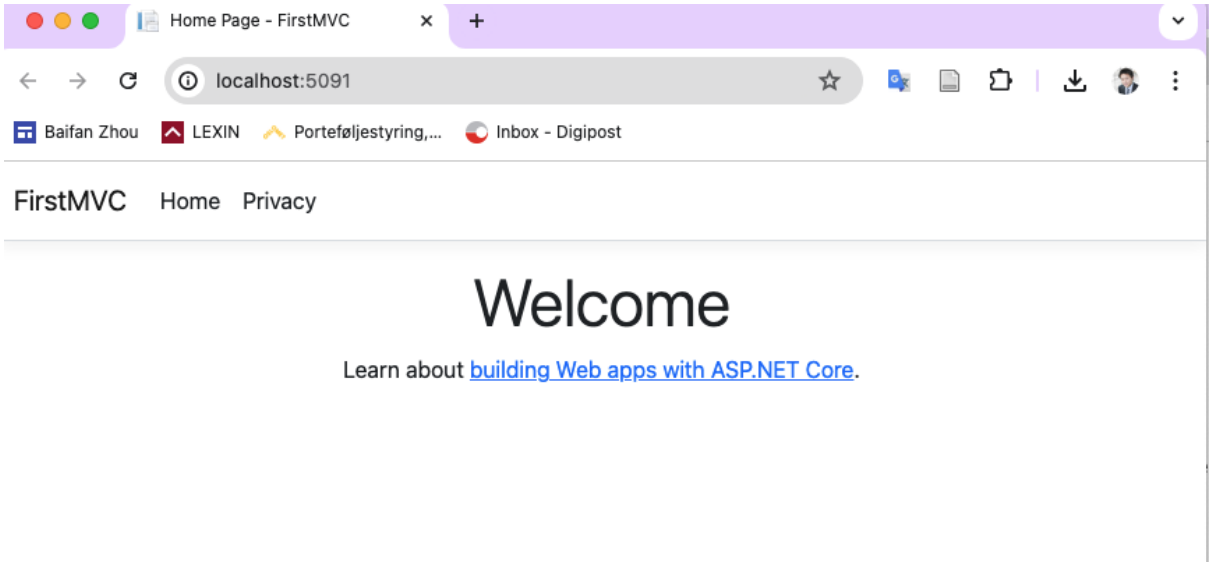

In the terminal, type: `dotnet run`.

The MVC project is now running. From the Terminal you can see the URL to access it. Type the URL shown the terminal in a browser. In my case, it is http://localhost:5091/

You can also Ctrl/Command click the URL to access it.

In the browser, you can see the web app you just built.

You can click Home, Privacy to navigate.

To terminate the project running, press Ctrl + C in the terminal.

Congratulations! You have finished your first Web app with both front-end and back-end. ☺
